ISSUES THAT MATTER

"We realized there was a relatively limited range of designs in outdoor several years ago," explains Gary McCray, president of Klausner Outdoor. "And we felt we could develop lighting that would both address that void and complement our furniture designs."

Unlike Watermark Living, though, Klausner went in a different direction.

"We have purposely avoided working from the indoors-out and have designed our lamps with outdoor function and durability in mind," McCray continues. "Until now we have focused on synthetic wicker, aluminum and stainless steel construction that clearly look like styles that are meant to be in outdoor environments."

"With the advances in resin, we are able to craft realistic lamp bases of natural and artistic subjects with fine coloration and detailing," Harper says. "Advances also have been made in lightbulb design and protection for outdoor use."

Improvements in material technology have been one factor in advances in outdoor lighting, especially the use of resins and polymers. But other technical innovations are driving outdoor lighting to be a statement—among them, the rise of LEDs, improved battery technology and IoT (Internet of Things) integration.

LEDs have been a breakthrough for outdoor lighting in a variety of ways. First is efficiency—they use up to 75% less power and produce less heat than incandescents. Then there's longevity—they last up to five times longer than comparable bulbs.

Because of the decreased power usage, battery-powered LED lights have helped companies like Jardinico create cordless lanterns that can be placed anywhere. "The design of our products is a stand-alone light source, and there are battery/electric candles to place in our lanterns," Dorr says.

Low power consumption is also ideal to match with a solar panel. Klausner is among several that have solar-powered

lights on the drawing board.

With the advent of smartphones and the interconnected devices, more end-users are looking for connectivity with their lighting.

McCray hints that Klausner has some IoT products in the works. But Dorr of Jardinico makes no bones about it. "We see the addition of smart lighting as a growing trend and it will be a part of our future planning," she says.

Designers are taking advantage of the flexibility of new technologies, as

very tranquil and calming by day; but as night falls it can be ablaze with drama created through lighting sources to provide a totally different appeal."

Pal Lighting has embraced LEDs in a big way. They've become an increasingly popular choice for OEMs, builders and renovation companies worldwide. Everything from pool lights to accent lights to light ribbons—all LEDs that can change color with the Pal Color Touch system, which gives the user the ability to wirelessly control pool lighting, landscape and feature lighting all from the one system.

"Our passion is to be able to light up any space," says Raymond Thibault, director of business development for Pal's U.S. distributor. "Whether it's a spa or plunge pool to an immense resort pool with running streams, exotic lagoons, children's play areas and all things in between,"

The result is a diverse line of pool, spa, landscape and water feature lights.

"We offer affordable options for every market level to use LED lighting as a design or architectural feature of the backyard," Thibault says.

As technology continues to advance and more companies enter the fray, the exterior lighting pie will certainly continue to expand.

"Homes continue to be designed and built incorporating these areas," McCray says. "And I don't see that changing."

WE HAVE PURPOSELY
AVOIDED WORKING FROM
THE INDOORS-OUT AND HAVE
DESIGNED OUR LAMPS WITH
OUTDOOR
FUNCTION AND
DURABILITY IN
MIND.
